Soil Hydrology & Infiltration — SCS Curve Number

physicalEnv/soil.py: soil map × land cover × groundwater → hydrologic soil group → curve number → infiltrated share of a rain event

Soil group from the Dutch texture words in the soil name (zand A · zavel/leem B · lichte klei C · klei/veen D); the most restrictive layer wins.
NEH 630: a water table within 60 cm makes a soil group D; drained land covers (urban fabric, industrial, roads, ports, airports) keep their texture letter.
BIS has no GHG/GLG under most built-up land (85 % of urban-fabric cells in Enschede) or water: nodata counts as not shallow; water/wetland CN = 100/98.
The rain depth enters only the pure SCS functions; the spatial query depends on the season alone (cacheable, currently re-run per request).
