On-Demand Calculations — LST & Sky View Factor

Actions menu → Calculate for this view: the current map view is computed in numpy and stored as one raster row

Both are synchronous requests (LST ~10–60 s). Earth Engine only serves the inputs; every equation runs in numpy.
Same tools from the shell: manage.py calculate_lst --city Enschede · physicalEnv.svf.calculate_svf(bbox=…).

Browser · Django view / orchestration · Earth Engine · numpy / raster · Storage
